

What Makes Everest Different?

ONE MOVING PART

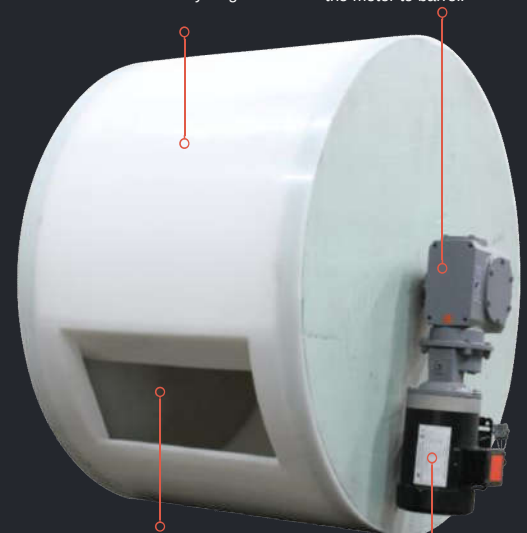

Introducing VersaVend

The difference between the Everest VX models and every other ice vending machine comes down to one thing: Less moving parts. The VX models use the VersaVend system, a patented ice dispensing system that uses ONE moving part to collect ice from the ice maker, agitate the ice to eliminate clumping, insulate the ice to maintain temperature and freshness, and dispense the ice to your customers. This ONE PART does it all.

Other machines require a complex system of mechanical blowers, agitators, chain drives, cogs and augers to accomplish what VersaVend does with ONE PART. Less parts means less things break down and need to be replaced, and less operator headaches.

The VersaVend drum holds 550 lbs of ready-to-go ice.

A highly reliable Cleveland Gearbox transfers the power of the motor to barrel.

The patented ice dispensing design allows for 10 lbs of ice for every drum rotation without the use of agitation arms or beater bars..

The power to rotate the barrel is provided by a 2HP motor.
