

VERSAVEND

ONE MOVING PART

WHAT IS VERSAVEND?

Everest's VersaVend system is our patented ice dispensing system that uses ONE moving part, virtually eliminating all moving parts our competitors use.

The difference between the Everest VX models and every other ice vending machine comes down to one thing: less moving parts. The VX models use the VersaVend system. This means using only ONE moving part to collect the ice from the ice maker, agitate the ice to eliminate clumping, insulate the ice to maintain temperature and freshness, and dispense the ice to your customers. This ONE PART does it all.

Other machines require a complex system of mechanical blowers, agitators, chain drives, cog and augers to accomplish what VersaVend do with ONE PART. Less parts means less things break down and need to be replaced, and less operator headaches.

Drum hold 550 lbs of ready-to-go ice

Highly reliable Cleveland Gearbox transfers the power of the motor to the barrel

Patented ice dispensing design allows for 10lbs of ice with every drum rotation

2HP Motor powers the barrel rotation

OVER 2 MILLION VENDS WITHOUT A JAM AND COUNTING
